

## GOOD PHARMACOPOEIAL PRACTICES

(DRAFT 14 JANUARY 2015)

*REVISED DRAFT FOR COMMENT*

Please address any comments on this proposal by **10 March 2015** to Dr S. Kopp, Group Lead, Medicines Quality Assurance, World Health Organization, 1211 Geneva 27, Switzerland, fax: (+41 22) 791 4730 or email: [kopps@who.int](mailto:kopps@who.int) with a copy to [gaspardm@who.int](mailto:gaspardm@who.int).

This draft is intended for a restricted audience only, i.e. the individuals and organizations having received this draft. The draft may not be reviewed, abstracted, quoted, reproduced, transmitted, distributed, translated or adapted, in part or in whole, in any form or by any means outside these individuals and organizations (including the organizations' concerned staff and member organizations) without the permission of the World Health Organization. The draft should not be displayed on any web site.

Please send any request for permission to:

Dr Sabine Kopp, Group Lead, Medicines Quality Assurance, Technologies, Standards and Norms, Regulation of Medicines and other Health Technologies, Department of Essential Medicines and Health Products, World Health Organization, CH-1211 Geneva 27, Switzerland. Fax: (41-22) 791 4730; email: [kopps@who.int](mailto:kopps@who.int).

The designations employed and the presentation of the material in this draft do not imply the expression of any opinion whatsoever on the part of the World Health Organization concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries. Dotted lines on maps represent approximate border lines for which there may not yet be full agreement.

The mention of specific companies or of certain manufacturers' products does not imply that they are endorsed or recommended by the World Health Organization in preference to others of a similar nature that are not mentioned. Errors and omissions excepted, the names of proprietary products are distinguished by initial capital letters.

All reasonable precautions have been taken by the World Health Organization to verify the information contained in this draft. However, the printed material is being distributed without warranty of any kind, either expressed or implied. The responsibility for the interpretation and use of the material lies with the reader. In no event shall the World Health Organization be liable for damages arising from its use.

This draft does not necessarily represent the decisions or the stated policy of the World Health Organization.

36 SCHEDULE FOR THE PROPOSED ADOPTION PROCESS OF DOCUMENT QAS/13.526:  
37 *GOOD PHARMACOPOEIAL PRACTICES*

Need for good pharmacopoeial practices (GPhP) stated during first international meeting of world pharmacopoeias, Geneva, and other related events with stakeholders	28 February–1 March 2012 7–8 October 2012 9–12 October 2012 21–22 October 2012
First draft of good pharmacopoeial practices (GPhP) sent out for comment (QAS/12.516)	17 October 2012
Compilation of feedback and comments received	November–December 2012
Circulation of GPhP to drafting group on good pharmacopoeial practices with comments, as well as Concept paper on scope and background (QAS/13.518)	18 January 2013
Formation of initial drafting group (IDG), including representatives from each pharmacopoeia, as per self-nomination, to review draft concept paper via teleconference call	February 2013
Preparation of new skeleton and first draft with more detailed structure	February 2013
Mailing to world pharmacopoeias for additional feedback, preparation of draft chapters by drafting group	February–March 2013
Compilation of feedback	April 2013
Discussion of draft working document on good pharmacopoeial practices at second international meeting of world pharmacopoeias, New Delhi, India	18–19 April 2013
Revised version of GPhP prepared and mailed out for comments to all pharmacopoeias, for feedback to be provided to lead pharmacopoeias for each chapter	28 May 2013
Discussion of feedback during informal consultation to discuss new medicines, quality control and laboratory standards	12–14 June 2013
Revision of each chapter by each GPhP lead pharmacopoeia	28 June 2013

Mailing of each chapter to WHO for compilation into a revised working document	July 2013–December 2013
Presentation to forty-eighth meeting of the WHO Expert Committee on Specifications for Pharmaceutical Preparations	October 2013
Compilation of all various chapters received from the lead pharmacopoeias and mailing out to all world pharmacopoeias	January 2014
Compilation of all comments received	March 2014
Discussion during the 3rd international meeting of world pharmacopoeias in London, United Kingdom	10–11 April 2014
Revised version of GPhP prepared and mailed out for comments to all pharmacopoeias, for feedback to be provided to each chapter	July 2014
Compilation of all comments received	22 September 2014
Following feedback and discussions during two telephone conference calls of the subgroup working on the Technical Annex to the future GPhP the Ph.Eur. Secretariat prepared a significantly shortened draft which is circulated for comments	23 September 2014
Compilation of all comments received	30 September 2014
Discussion during the 4th international meeting of world pharmacopoeias in Strasbourg, France	8–10 October 2014
Briefing on progress to forty-ninth meeting of the WHO Expert Committee on Specifications for Pharmaceutical Preparations	13–17 October 2014
Continuation of consultation process with world pharmacopoeias	October 2014–January 2015
Continuation of consultation process with world pharmacopoeias and worldwide	Mid-January–mid-March 2015
Compilation of all comments received	10–15 March 2015

Discussion of feedback during the 5th international meeting of world pharmacopoeias in Washington, USA	20–22 April 2015
Continuation of consultation process with world pharmacopoeias and worldwide	May–July 2015
Compilation of all comments received	15 August 2015
Discussion during the 6th international meeting of world pharmacopoeias	September 2015, dates tbc with host
Presentation to the fiftieth meeting of the WHO Expert Committee on Specifications for Pharmaceutical Preparations	12–16 October 2015
Any follow-up action as necessary

REVISED DRAFT 5 FOR COMMENT

## GOOD PHARMACOPOEIAL PRACTICES

### 1. BACKGROUND

Harmonization efforts in the area of pharmacopoeias started more than a century ago. The World Health Organization (WHO) was mandated with its Secretariat in 1948. This led to the creation of *The International Pharmacopoeia*, which was the first global pharmacopoeial activity. Many others followed.

Pharmacopoeias are embedded in their respective national or regional regulatory environment. Retrospective harmonization has proven difficult to achieve. Prospective harmonization may be easier but presents certain challenges after the initial work has been done, as the maintenance process over time of the pharmacopoeial standards (pharmacopoeial texts and reference standards) needs to be viewed within a long-term perspective.

The term “harmonization” may be legally binding and therefore have different connotations in the national and regional context. In the context of this document “harmonization” is maintained in some parts in the view of its historical use and is understood to mean the following: “The process through collaborative effort whereby differing requirements within participating pharmacopoeias move towards becoming more similar or aligned over time.” This is nowadays also referred to as “convergence” [Note from Secretariat: cross-reference to the new Good Review Practices definition as footnote will be added].

Developments in science and medical practice, globalization and the presence of spurious/falsified/falsely labelled/counterfeit (SFFC) products require pharmacopoeias to constantly revise. Convergence and reinforced collaboration among pharmacopoeial committees and regulators, supported by adequate interaction with industry, will assist in facing new challenges and resource constraints.

106 A first initiative to reopen the discussion on international harmonization of quality  
107 control specifications on a global scale was taken in a side meeting of the 10th  
108 International Conference of Drug Regulatory Authorities (ICDRA) entitled:  
109 "Pharmacopoeial Specifications – Need for a Worldwide Approach?" in Hong Kong on  
110 24 June 2002. This further led to discussions among regulators during the 11th ICDRA  
111 meeting held in Madrid in 2004.

112  
113 Other international events during the following years enabled discussions with and  
114 among pharmacopoeias on this topic.

115  
116 In 2012 a series of meetings and events focused on and reopened this debate worldwide  
117 among the pharmacopoeias and their stakeholders. These events included:

- 118  
119 – 28 February–2 March 2012: the first international meeting of world  
120 pharmacopoeias held at WHO, Geneva, Switzerland;
- 121  
122 – 7–8 October 2012: joint FIP-WHO Conference during the FIP Centennial  
123 Congress, Amsterdam, Netherlands;
- 124  
125 – 9–12 October 2012: forty-seventh meeting of the WHO Expert Committee on  
126 Specifications for Pharmaceutical Preparations, Amsterdam, Netherlands;
- 127  
128 – 21–22 October 2012: pre-ICDRA meeting on *Quality of medicines in a*  
129 *globalized world: focus on active pharmaceutical ingredients*, Tallinn,  
130 Estonia;
- 131  
132 – 23–26 October 2012: 15th International Conference of Drug Regulatory  
133 Authorities (ICDRA), Tallinn, Estonia.

134  
135 The main emerging suggestion from all these events was the development of good  
136 pharmacopoeial practices to favour harmonization/convergence facilitated by WHO.

137

138 A number of pharmacopoeias agreed to participate in an initial drafting group.

139

140 It was agreed to develop the good pharmacopoeial practices under the auspices of the  
141 WHO Expert Committee on Specifications for Pharmaceutical Preparations, benefiting  
142 from its well-established international standard-setting processes and procedures. These  
143 processes include an international wide consultation process, which enables participation  
144 of all stakeholders and users in the development process. The final guidance would then  
145 be presented, in line with the procedure, to WHO's 194 Member States and  
146 pharmacopoeial authorities.

147

## 148 2. **PURPOSE OF GOOD PHARMACOPOEIAL PRACTICES**

149

150 The primary objective of the *WHO Good Pharmacopoeial Practices* (GPhP) guidance is  
151 to converge approaches and policies in establishing pharmacopoeial standards, which will  
152 support regulatory authorities in controlling the quality of pharmaceutical ingredients,  
153 their finished products and other materials and will provide a tool by which the user or  
154 procurer can make an independent judgement regarding quality, thus safeguarding the  
155 health of the public.

156

157 GPhP describes a set of principles that provides guidance for national pharmacopoeial  
158 authorities (NPAs) and regional pharmacopoeial authorities (RPAs) which facilitates the  
159 appropriate design, development, maintenance, publishing and distribution of  
160 pharmacopoeial standards.

161

## 162 3. **BENEFITS OF GOOD PHARMACOPOEIAL PRACTICES**

163

164 GPhP is designed to facilitate collaboration among pharmacopoeias leading to  
165 possibilities for work sharing, harmonization/convergence of standards, and the  
166 recognition of published standards between NPAs and RPAs), increasing access to and  
167 availability of affordable, quality medicines.

168

169 In addition to the above the establishment of GPhP may result in the following:

170

- 171 - strengthening of global pharmacopoeial cooperation;
- 172 - providing stakeholders with a better understanding of how pharmacopoeial
- 173 standards are developed and maintained in a transparent manner;
- 174 - improving cooperation between NPAs/RPAs and stakeholders (e.g. regulators,
- 175 industry) with a view to facilitating the global harmonization/convergence of
- 176 pharmacopoeial standards, to reduce duplication of work.

177

178 Pharmacopoeial standards that are developed following GPhP can be relied upon for  
179 adequately validated analytical procedures and suitable reference standards for assessing  
180 conformity of pharmacopoeial requirements and to assure access to affordable, safe,  
181 effective and high-quality medicines. Adherence to GPhP can foster exchanges, work  
182 sharing and acceptance of monographs among pharmacopoeias.

183

184 GPhP should ultimately enable convergence and harmonization of pharmacopoeial  
185 standards.

186

#### 187 **4. IMPLEMENTATION**

188

189 While the implementation of the GPhP by NPAs and RPAs is voluntary it is  
190 recommended and encouraged, as a high level of participation will result in greater  
191 benefit to the stakeholders and ultimately to patients.

192

#### 193 **5. MONOGRAPH DEVELOPMENT**

194

195 Development of a monograph requires consideration of information and candidate  
196 materials. This information may come from, e.g. donors, literature, various publicly  
197 available material, from other pharmacopoeias or may be generated within the laboratory  
198 resources of a pharmacopoeia. The draft text should be displayed for public comments.

199

200 Pharmacopoeias are encouraged to conform where possible to the work of harmonization  
201 bodies and initiatives towards convergence (e.g. WHO, International Conference on  
202 Harmonisation (ICH) and Pharmacopoeial Discussion Group (PDG).

203

## 204 **5.1 General considerations**

205

206 Pharmacopoeial monographs generally cover chemical, biological and herbal medicines  
207 and their ingredients approved by national regulatory authorities and/or otherwise legally  
208 marketed within a national or regional sphere of control. Some pharmacopoeias also  
209 include standards for, e.g. medical devices, nutritional ingredients and products.

210

211 Specifications in pharmacopoeias are one facet of the overall control of the quality of  
212 finished pharmaceutical products (FPP) and their constituents (components, ingredients).  
213 Monographs provide publicly-available standards that a product or a component of a  
214 product is expected to meet at any time during its period of use. Thus, a substance should  
215 be able to demonstrate compliance with a pharmacopoeial monograph up to the point at  
216 which it is used to prepare a finished dosage form. An FPP should demonstrate  
217 compliance with a monograph, if available, throughout its shelf-life. Pharmacopoeial  
218 specifications are used within pharmaceutical product marketing authorization systems  
219 and by manufacturers, suppliers, purchasers and those acting on behalf of patients.

220

221 Before the process of writing a monograph can begin, it is important to consider the tests  
222 that are required to demonstrate the quality of a given substance or pharmaceutical  
223 product; specifications that favour one manufacturer to the exclusion of others should be  
224 avoided.

225

226 For example, the ICH guidelines Q6A (*Specifications: test procedures and acceptance*  
227 *criteria for new drug substances and new drug products: chemical substances*) could be  
228 used as a basis. Whenever possible, the specifications should be applied consistently in  
229 monographs across all participating pharmacopoeias. For example, certain regions

230 specify compliance with manufacturing-based testing (usually measures of the physical  
231 or physicochemical acceptability) in the specific monograph, while others incorporate  
232 these requirements in General monographs for a particular pharmaceutical product.

233

234 Additional tests might be added by NRAs and RPAs depending on, e.g. national/regional  
235 regulations.

236

237 Monographs set forth an article's nonproprietary name, definition, specification and may  
238 include other requirements such as packaging and storage. The specification consists of  
239 tests, procedures and acceptance criteria that define quality aspects as to the identity,  
240 strength and purity of the monographed material.. Pharmacopoeial monographs provide  
241 an important tool for assurance of the quality and safety of marketed pharmaceutical  
242 ingredients and products through testing of their quality.

243

244 Pharmacopoeial standards allow independent testing and are a critical part of the “safety  
245 net” of standards that help ensure the quality, safety and efficacy of medicines. They are  
246 closely allied with good manufacturing practice (GMP) standards, which are process  
247 standards.

248

249 Pharmacopoeial monograph procedures often call for suitable reference standards.

250

### 251 **5.1.1 General principles**

252

253 (a) Pharmacopoeial standards should be available for medicines and their  
254 ingredients and associated materials. They are usually based on the shelf-life  
255 specifications approved by regulatory authorities [*\*add footnote: In the case of*  
256 *The International Pharmacopoeia specifications are developed for those medicines*  
257 *included in The Essential Medicines List (EML) and those that are of major*  
258 *public health interest, including, e.g. those that are on the Expression of interest*  
259 *(EOI) for prequalification by WHO] or on the specifications provided by*  
260 *manufacturers of unlicensed products.*

261

262 (b) The monographs may employ various validated analytical procedures for the tests  
263 that are feasible to be performed and a trained and experienced analyst could perform  
264 without any repetition or development of new procedure. The validation of analytical  
265 procedures described in monographs should comply with the requirements as laid  
266 down, for example, in the WHO [ Ref: Supplementary guidelines on good  
267 manufacturing practices: validation, Appendix 4 on Analytical method validation, in  
268 WHO Technical Report Series, No. 937, 2006, Annex 4] and ICH guidelines [Ref:  
269 (Q2R1) “Validation of Analytical Procedures: Text and Methodology”].

270

271 (c) Pharmacopoeial standards are public standards that are science-based and data-  
272 driven and based on sound analytical measurement and accompanying validation data.

273

274 (d) A pharmacopoeia’s core mission is to protect public health by creating and  
275 making available public standards to help ensure the quality of medicines.

276

277 Pharmacopoeias respect the intellectual property of donors and recognize the importance  
278 of maintaining the confidentiality of proprietary third-party information. Pharmacopoeias  
279 endeavour to work collaboratively with manufacturers and regulators and other  
280 stakeholders in the development of public standards.

281

### 282 ***5.1.2 Adoption of pharmacopoeial standards***

283

284 (a) Text in a pharmacopoeial monograph and general chapter is approved by an  
285 expert body of the pharmacopoeia, following publicly available rules and procedures,  
286 including public consultation and applicable conflict of interest and confidentiality rules.

287

288 (b) Reference standards cited in a monograph and/or their compendial uses also are  
289 approved by a pharmacopoeial expert body.

290

291 **5.1.3 Open and transparent process**

292

293 Pharmacopoeias ensure openness and transparency throughout the development of  
294 pharmacopoeial standards, which includes:

295

- 296 (i) engaging stakeholders in the routine development and revision of  
297 pharmacopoeial standards through adequate and timely public notice and  
298 comment;
- 299 (ii) inviting the participation of stakeholders, especially when the discussion  
300 has impact on the access to medicines;
- 301 (iii) engaging stakeholders in the accelerated development and revision of  
302 standards to address major public health concerns;
- 303 (iv) timely inclusion of strategic monographs that address major public health  
304 demands;
- 305 (v) rapid correction of errors published in compendial text, when necessary;
- 306 (vi) timely and appropriate revision and/or withdrawal of compendial  
307 standards, when necessary. The legal status of monographs that have been  
308 withdrawn will depend on the national regulatory framework.

309

310 **5.1.4 Continuous revision**

311

312 Pharmacopoeial standards are in a continuous revision process to ensure that they are  
313 based on current scientific knowledge.

314

315 **5.1.5 Harmonization**

316

317 Pharmacopoeias should harmonize standards wherever possible, through monographs and  
318 general chapters. Harmonization may occur through several processes including, but not  
319 limited to: adoption/adaptation of existing standards; revision of a standard between two  
320 or more pharmacopoeias (bilateral or multilateral harmonization); development of a new

321 standard through coordinated consideration (prospective harmonization); revision or  
322 creation of standards through a coordinating body (e.g. PDG); or other approaches.

323

#### 324 **5.1.6 Legal recognition**

325

326 Pharmacopoeial monographs may acquire legal status and then become subject to  
327 enforcement depending on applicable national or regional requirements.

328

#### 329 **5.1.7 Compliance with a pharmacopoeial monograph**

330

331 Any substance or product subject to a monograph must comply with all of the mandatory  
332 requirements within the pharmacopoeia throughout its period of use or shelf-life.

333

334 The assays and tests described are the official methods upon which the standards of the  
335 pharmacopoeia depend. The analyst may not be precluded from employing alternative  
336 methods depending on national and regional legislation. A validation of the alternative  
337 analytical procedure should be done to show at least an equivalent performance to the  
338 analytical procedure described in the monograph. If an alternative analytical procedure is  
339 used, it is necessary to provide a rationale for its inclusion and identify its use (e.g.  
340 release, stability testing), validation data and comparative data to that of the analytical  
341 procedure described in the monograph, subject to regulatory approval.

342

343 In case of doubt or dispute the official pharmacopoeia methods prevail and are alone  
344 authoritative.

345

#### 346 **5.1.8 Analytical requirements**

347

348 Pharmacopoeial methods and limits are set with the intention that they should be used as  
349 compliance requirements and not as requirements to guarantee total quality assurance.

350 To achieve maximum benefit from the examination of a product, the recommended

351 approach is that, wherever possible, a variety of different analytical techniques should be

352 employed, considering the feasibility and affordability of the methods. As analytical  
353 methods become more precise, it will become increasingly possible to combine precision  
354 with specificity which optimize analytical effort and time.

355

### 356 **5.1.9 Acceptance criteria**

357

358 Acceptance criteria are numerical limits, ranges or other suitable measures for acceptance  
359 of the results of analytical testing to allow determination of pass/fail criteria. Acceptance  
360 criteria indicated in a pharmacopoeial monograph allow for analytical error, for  
361 unavoidable variations in manufacturing processes and for deviations to an extent  
362 considered acceptable under practical storage conditions. They provide standards with  
363 which substances or products must comply throughout their shelf-life or period of use.  
364 Different acceptance criteria may be required depending on the national or regional  
365 regulatory authorities.

366

## 367 **5.2 Technical guidance**

368

369 The technical guidance provided in this section shall be considered as the minimal  
370 requirements agreed between the participating pharmacopoeias. They do not preclude  
371 national or regional pharmacopoeias to supplement such requirements in their  
372 monographs due, e.g. to national/regional regulations.

373

### 374 **5.2.1 Monographs for pharmaceutical substances**

375

376 Prior to the preparation of any monograph, it is essential to gather as much information as  
377 possible on the substance in question.

378

379 In particular it is necessary to ascertain:

380

- whether the substance is of natural, synthetic or semi-synthetic origin;

381

- whether the substance is a mixture or a single entity;

- 382 • the method(s) of preparation of the substance;
- 383 • intrinsic properties of the substance that contribute to its identity and classification  
384 such as solubility or optical rotation;
- 385 • whether there are differences in physical form, for example, crystallinity or  
386 polymorphism since these properties may affect the behaviour of the substance ;
- 387 • whether a single optical isomer (e.g. enantiomer) as well as mixtures of isomers (e.g.  
388 racemate) are available;
- 389 • whether anhydrous or different hydrates are available;
- 390 • whether different entities (acid, base, salt, etc.) are available.

391

392 Substances that are to be described in a monograph may be members of a group of very  
393 similar substances (family).

394 A master monograph may be drafted stating the attributes common to all members of the  
395 family and that can be used to identify single members of the family (family monograph).

#### 5.2.1.1 *Monograph title*

396 The International Nonproprietary Name (INN) or modified INN (INN<sub>M</sub>) established by  
397 WHO should be considered for use wherever it is available, while recognizing that  
398 individual pharmacopoeias may apply their own nomenclature policies.

399

#### 5.2.1.2 *General information to define the pharmaceutical substance*

400 A pharmacopoeial monograph includes information regarding the pharmaceutical  
401 substance, such as:

- 402 • graphic formula. The recommendations of WHO on the drawing of structures  
403 should be followed;

- 404       • empirical/molecular formula and relative molecular mass. The latter is calculated  
405       based on the figures of the International Table of Relative Atomic Masses  
406       considering where appropriate the degree of hydration;
- 407       • Chemical Abstracts Service (CAS) registry number, if available;
- 408       • chemical name.

409

410 This implies, but is not limited to, investigating in particular:

- 411       • the possible existence of isomers so as to be able to specify which isomer is used  
412       or, otherwise, to state that the product is a mixture of isomers;
- 413       • in the case of an optical isomer, the absolute configuration is given by the *R/S*  
414       system at the asymmetrical centre(s) or any other appropriate system (e.g. for  
415       carbohydrates and amino acids);
- 416       • ascertaining the state of hydration or solvation by an appropriate technique, so as  
417       to distinguish clearly between the well-defined hydrates and solvates and the  
418       products that contain variable quantities of solvent(s). As regards the former,  
419       water or solvent content ranges are specified but for the latter only a maximum  
420       content is given. When a substance exists both in a non-hydrate or solvent-free  
421       form and in the form of (a) hydrate(s) or (a) solvate(s) with different water or  
422       solvent contents, and if all these forms are used and can be clearly distinguished,  
423       they may be treated as individual substances.

424 5.2.1.2.1 *Combinations*

425 In therapeutics, more or less well-defined chemical combinations or even mixtures are  
426 sometimes used. In such cases, it is necessary to specify precisely each component of the  
427 combination or mixture, with its chemical structure and the proportion in which it is  
428 present.

429 5.2.1.3 *Content*

430 Assay limits are specified between which the content falls. The content may be also  
431 defined in a one-sided manner. The assay limits take account of the precision of the

432 method as well as the acceptable purity of the substance. Assay limits are normally  
433 expressed with reference to the dried, anhydrous and/or solvent-free substance.

434

435 In setting these limits for the active ingredient content, account is taken of:

- 436 • the method of preparation, which determines the degree of purity that may be  
437 reasonably required;
- 438 • the precision and accuracy of the analytical method;
- 439 • where a separation technique is employed both for the test for related substances  
440 and the assay, content limits are set taking into account the maximum permitted  
441 amount of impurities and the analytical error;
- 442 • the evaluation of the tolerable degree of degradation during storage (since the  
443 limits are intended to apply throughout the shelf-life of the substance and not just  
444 at the time of testing);
- 445 • a sufficient number of experimental results obtained on several batches (at least  
446 3), if possible, of different origins and ages.

#### 5.2.1.4 *Qualitative properties of the pharmaceutical substance*

447 The statements under this heading may not be interpreted in a strict sense and are not  
448 regarded as analytical requirements. Caution statements may be included here.

449

450 The principal items that may be referred to are the following:

- 451 • appearance;
- 452 • solubility;

- 453 • stability factors;
- 454 • hygroscopicity;
- 455 • solid-state properties;
- 456 • other characteristics, as necessary.

#### 5.2.1.5 Identification

457 The tests given in the identification section are not designed to give a full confirmation of  
458 the chemical structure or composition of the substance. They are intended to give  
459 confirmation with an acceptable degree of assurance that the substance is the one stated  
460 on the label. The physical and/or chemical tests and reactions, when taken together, that  
461 enter into the Identification section ensure, as far as possible, specificity. The specificity  
462 of the identification should be such that active substances and excipients exhibiting  
463 similar structures are distinguished. When an identification series is being investigated, it  
464 is desirable that other similar substances, whether or not they are the subject of  
465 monographs of the pharmacopoeia, are examined at the same time to ensure that a  
466 particular combination of tests within a series will successfully distinguish one similar  
467 substance from another. False positive reactions caused by the presence of tolerated  
468 impurities are to be avoided.

469  
470 Some of the purity tests in a monograph may also be suitable for identification purposes,  
471 possibly in a modified form. A system of cross-references to the section(s) can be  
472 exploited. This is particularly relevant in cases where distinction between closely related  
473 materials depends on properties that are also parameters in purity or composition control.  
474 In some cases an organic impurities procedure may be introduced to differentiate the  
475 analyte from similar, common, dangerous adulterants.

476  
477 In the case of a family monograph, identification of the type of substances may be  
478 supplemented by non-specific but discriminating tests to identify individual members of  
479 the family.

5.2.1.6 *Impurities and other tests*

480 **5.2.1.6.1 Organic impurities**

481 This section is principally directed at limiting impurities in chemical substances.

482

483 In the interest of transparency, information may be included on: the impurities controlled  
484 by a test; the approximate equivalent (percentage, ppm, etc.) of the prescribed limit in  
485 terms of the defined impurities or class of impurities.

486

487 Certain tests may apply to special grades (parenteral, dialysis solutions, etc.) or a test may  
488 have a special limit for a particular use: the particular application of a test/limit is  
489 indicated within the test.

490

491 Monographs should include tests and acceptance criteria for impurities that are likely to  
492 occur in substances used in approved medicinal products, insofar as the necessary  
493 information and samples (substance and impurities) are available from the producers.

494 Monographs on organic chemicals usually have a test entitled “Related substances” (or a  
495 test with equivalent purpose under a different title), designed to control related organic  
496 impurities. Impurities to be controlled include: intermediates and by-products of  
497 synthesis, co-extracted substances in products of natural origin, degradation products.

498 Monographs on active pharmaceutical ingredients (APIs) should take account of the  
499 principles defined in ICH guideline Q3A (R2) “Impurities in New Drug Substances”, or  
500 comparable guidelines and follow regulatory decision-making. Products of fermentation  
501 and semi-synthetic products derived therefrom, should be limited applying the same  
502 principles but be covered by thresholds considered appropriate for these products. The  
503 same principle applies to excipients.

504

505 Unusually potent or toxic impurities. In addition to the above-mentioned requirements,  
506 impurities that are unusually potent or produce toxic or unexpected pharmacological  
507 effects, need to be specifically considered. In this context requirements for genotoxic  
508 impurities may be followed.

509

510 Monographs frequently have to be designed to cover different impurity profiles because  
511 of the use of different synthetic routes and purification procedures by producers.

512

513 For pharmacopoeial purposes the objective of a purity test using a separation method will  
514 usually be the control of impurities derived from one or more known manufacturing  
515 processes and decomposition routes. However, the experimental conditions are chosen  
516 for the test, especially the detection system, so as not to make it unnecessarily narrow in  
517 scope.

518

519 Monographs should provide a reliable means of locating all specified impurities on the  
520 chromatogram. Identification of unspecified impurities is necessary if a correction factor  
521 is to be applied.

#### 522 **5.2.1.6.2 Inorganic impurities**

523 Inorganic impurities include reagents, ligands and catalysts, elemental impurities,  
524 inorganic salts and other materials such as filter aids (where relevant).

525

526 Known impurities, likely to be present, are typically covered by specific tests.

#### 527 **5.2.1.6.3 Residual solvents**

528 Residual solvents need to be controlled, for example, as outlined in the ICH Guideline  
529 Q3C.

#### 530 **5.2.1.6.4 Other tests**

531 The following tests should be considered, but are not limited to :

532 • foreign anions and/or cations;

533 • loss on drying;

534 • semi-micro determination of water (Karl Fischer);

535 • micro determination of water (coulometric titration);

536 • sulfated ash/residue on ignition;

537 • residue on evaporation

- 538 • sterility;
- 539 • microbiological purity;
- 540 • bacterial endotoxins.
- 541

#### 5.2.1.7 Assay

542 Assays are included in monographs unless otherwise justified. In certain cases, more than  
543 one assay may be necessary when:

- 544 • the substance to be examined consists of a combination of two parts that are not  
545 necessarily present in absolutely fixed proportions, so that the assay of only one  
546 of the two constituents does not make it possible correctly to determine the  
547 substance as a whole;
- 548 • the results of the quantitative tests do not fully represent the therapeutic activity,  
549 in which case a biological assay is included.

550

551 In the case of well-defined salts, the assay of only one of the ions, preferably the  
552 pharmacologically active component, is generally considered sufficient.

553

### 554 **5.2.2 Monographs for finished products**

#### 555 5.2.2.1 General monographs

556 Where General monographs for pharmaceutical forms are prescribed, general tests may  
557 group together those tests that are applied to a specific pharmaceutical form and are not  
558 formulation specific; examples of this include uniformity of weight, friability and  
559 disintegration as applied to a tablet or the microbial quality of any finished product (i.e. a  
560 test for total aerobic microbial testing). These tests may be included in a general  
561 monograph for a pharmaceutical form, in this example, Tablets, as the test procedures are  
562 the same for all tablets.

563

564 Where prescribed, General monographs include analytical methods and acceptance  
565 criteria for all of the general tests required for a given pharmaceutical form.

566

567 5.2.2.2 *General information to define specific finished product monographs*

568 Specific tests group together those procedures that are required to provide evidence that a  
569 finished product is of a suitable quality and are specific to a particular pharmaceutical  
570 dosage form. Examples include identification, related substances assay and dissolution  
571 (for a finished product tablet monograph). Specific tests are measures of the purity,  
572 composition and drug release; these tests are dependent on the active substance and  
573 would be included in a finished product monograph.

574

575 It is necessary to ascertain:

- 576 • if the finished product contains a mixture or a single drug substance;
- 577 • whether the synthetic routes of the drug substance(s) used in the available finished  
578 products are different (the stability profile of the finished products may vary in  
579 accordance with this parameter);
- 580 • if the finished product monograph covers different entities (acid, base, salt, etc.) or  
581 not, e.g. when this is not possible;
- 582 • in case of polymorphism, if the crystallographic form of the entity must be mentioned  
583 in the finished product monograph; if different dosage strengths are described in one  
584 finished product monograph.

585

586 Monographs for specific finished products include analytical procedures and acceptance  
587 criteria for tests required for the specific finished product.

588

589 The monograph should be split up into the subsections including, but not limited to:

590

#### 5.2.2.4.1 **Monograph title**

591 The titles of monographs for finished products combine the appropriate drug substance  
592 name and pharmaceutical dosage form.

593 The accepted name should be based on the INN or national name wherever it is available  
594 (the common name should be used where an INN or national name is not available); it is  
595 supplemented, when required, as appropriate by the International Nonproprietary Name  
596 Modified (INN<sup>M</sup>), as agreed by the users of INNs. Where possible the INN should be  
597 used in the monograph title as this would reflect the expression of strength of a finished  
598 product as recommended by ICH Guidelines. The name is followed by the nationally or  
599 regionally accepted pharmaceutical dosage form taxonomy (or published standard term).  
600 For finished products containing more than one drug substance (“combination products”),  
601 the individual INNs should be used where possible. Combination Names (Co-names)  
602 may exist in national pharmacopoeias for prescribing purposes.

603

#### 5.2.2.4.2 Definition

604 This constitutes an official definition of the product that is the subject of the monograph.  
605 Such statements may include inter alia elements relating to the active pharmaceutical  
606 substance, an expression of the content and other essential features of the dosage form.  
607 Where specified, the definition in the General monographs describes the scope of the  
608 monograph.

609

610 The following should be observed:

611

- 612 • the drug substance will be referred to in this section; it is **not** necessary to  
613 reproduce the defining information found in the drug substance monograph within  
614 this section of the finished product monograph (i.e. chemical name, etc.);
- 615 • any reference to producing a salt of the active moiety in situ during the  
616 manufacture of the finished product should be made in this section;
- 617 • the composition of individual components in a drug substance should be described  
618 under content where necessary; the definition would refer only to the name of the  
619 drug substance.

620 **5.2.2.4.3 Content**

621 Assay limits are specified between which the content of the drug substance in the finished  
622 product must fall. Limits for each active substance (if more than one) or individual  
623 components are included. The assay limits must take account of the precision of the  
624 method as well as the strength of the finished product. Assay limits are normally  
625 expressed with reference to the active moiety or the label claim, in accordance with  
626 national or regional requirements.

627

628 Specific assays should be used where possible, for example, liquid or gas  
629 chromatography. Specific assays remove interference from excipients (formulation  
630 matrix) which could lead to significant errors when using non-specific assays. Limits  
631 should be justified and account be taken of:

632

- 633 • the strength of the finished product; the stability of the active substance in a  
634 specific finished product. Unstable active substances may require an increased  
635 content;
- 636 • in the case of antibiotics determined by microbiological assay, the content limit is  
637 expressed in International Units (IU); where these exist a content limit is given in  
638 terms of a range, i.e. *“The precision of the assay is such that the fiducial limits of  
639 error are not less than 95% and not more than 105% of the estimated potency.  
640 The upper fiducial limit of error is not less than 97.0% and the lower fiducial  
641 limit of error is not more than 110.0% of the stated number of IU”*;
- 642 • see also the section *Assay*.

643 **5.2.2.4.4 Identification**

644 The tests given in the identification section are not designed to give a full confirmation of  
645 the chemical structure or composition of the product. They are intended to give  
646 confirmation with an acceptable degree of assurance that the product is the one stated on  
647 the label. Special attention must be given to the sample preparation to ensure that the  
648 active substance is adequately extracted from the sample matrix.

649 The minimum number of tests is used commensurate with providing adequate assurance  
650 of identity. For example, the monograph may contain at least two procedures to identify  
651 the active substance(s) in a pharmaceutical dosage form; one test may be sufficient if the  
652 technique used is considered to be a fingerprint of the active moiety (e.g. infrared  
653 absorption spectrophotometry).

#### 5.2.2.4.5 Impurities and other tests

654 This section should include all of the specific tests that are required to prove the quality  
655 of the given pharmaceutical form and in line with the format of the pharmacopoeias in the  
656 different territories.

657

658 The Tests section is intended to:

- 659 • limit the impurities within the finished product. This includes degradation  
660 impurities throughout the shelf-life of the finished product and impurities that  
661 occur due to the manufacturing process. In certain circumstances it is necessary to  
662 control impurities from synthesis in the finished product, e.g. if they are known to  
663 be toxic or when they are detected in the test for related substances at a level  
664 greater than the limit for unspecified impurities;
- 665 • to ensure the homogeneity of the active substance(s) from dose to dose within the  
666 finished product;
- 667 • to take account of the influence of the sample matrix to restrict the release of the  
668 active moiety in the finished product (i.e. a dissolution test in a monograph for  
669 tablets);
- 670 • to limit the pyrogenic content of a parenteral finished product (i.e. a test for  
671 bacterial endotoxins or a monocyte activation test).

#### 5.2.2.4.6 Impurities: Title of test(s)

672 Where the test is intended to control specified and unspecified impurities the title of the  
673 test should be Related Substances or Related compounds or similar in-line with national  
674 or regional practices [*glossary*].

676

677 Where the test is intended to control one or a limited number of specified impurities the  
678 title of the test should indicate the impurity(ies) controlled.

679

#### 680 **5.2.2.4.7 Related substances [or Related compounds]**

681 Further to the section on drug substance monographs, the following should be considered  
682 for related substances of finished product monographs:

- 683 • specific, quantitative techniques (i.e. HPLC) are preferred;
- 684 • non-specific or non-quantitative techniques should be used only if a specific  
685 method is not available or suitable;
- 686 • methods should be developed with the aim to control degradation products and  
687 impurities. In certain circumstances it is necessary to control impurities from  
688 synthesis in the finished product, e.g. if they are known to be toxic or when they  
689 are detected in the test for related substances at a level greater than the limit for  
690 unspecified impurities;
- 691 • impurities being limited above the limit for unknown impurities in a finished  
692 product should be identified using a reference standard or other suitable  
693 techniques.

694 Monographs should take account of the principles as, for example, defined in ICH  
695 guideline Q3B (R2) “Impurities in New Drug Products” and follow regulatory decision-  
696 making.

697

#### 698 **5.2.2.4.8 Performance testing**

699 Depending on the dosage form adequate performance testing may need to be included in  
700 the monograph.

701

#### 702 **5.2.2.4.9 Uniformity**

703 Pharmaceutical preparations presented in single-dose units shall comply with the test(s) as  
704 prescribed in the relevant specific dosage form monograph.

705 *Acceptance criteria* would be specified regionally for a specific product/pharmaceutical  
706 form.

707

708 **5.2.2.5** *Other tests*

709 The following tests should be considered, but are not limited to, where applicable:

710

- 711 • *sterility*;
- 712 • *bacterial endotoxins*;
- 713 • *microbiological quality*.

714

715 **5.2.2.6** *Products of natural origin*

716 Attention needs to be paid to the requirements in the different territories for minimizing  
717 the risk of transmitting animal spongiform encephalopathy agents via human and  
718 veterinary medicinal products.

5.2.2.7 *Assay*

719

720 The Assay quantifies the amount of active substance in the finished product and certain  
721 excipients such as preservatives depending on national and regional legislation. Ideally  
722 the method used should be harmonized with that in the active substance or excipient  
723 monograph but this may not be possible because of the sample matrix.

724

725 Assays are included in all finished product monographs unless certain quantitative tests,  
726 similar to assays, are carried out with sufficient precision (uniformity of content, where a  
727 mean of individual results could be considered an accurate assay). In certain cases more  
728 than one assay may be necessary when:

- 729 • the finished product to be examined contains two, or more, active substances;
- 730 • for products such as antibiotics the results of the quantitative tests do not fully  
731 represent the therapeutic activity, in which case a microbiological assay and a test  
732 for composition are included.

733

734 Specific stability-indicating assays should be included in the monograph where possible.

735 This avoids interference from the sample matrix.

736

737 **7. ANALYTICAL TEST PROCEDURES AND METHODOLOGIES**  
738 **(ANALYTICAL METHOD)**

739  
740 Analytical test procedures and methodologies are employed to establish quality aspects  
741 such as identity, purity,, strength of drug substances and drug products. An analytical  
742 method mentioned in a pharmacopoeia should be simple, reliable, accurate, sensitive and  
743 specific.

744  
745 A pharmacopoeia provides, e.g. physical, physicochemical and chemical methods for  
746 analysis of quality of pharmaceutical substances and drug products (finished dosage  
747 forms). The type of method applied for analysis depends on the nature of the substance  
748 and product.

749  
750 The principles of method validation as, e.g. [*Ref: to WHO and ICH texts as above*] apply  
751 to all types of analytical procedures. It is established by demonstrating documentary  
752 evidence with respect to any particular pharmaceutical substance or product.

753  
754  
755  
756  
757  
758  
759  
760  
761  
762

REVISED DRAFT FOR COMMENT

763

## Glossary and Thesaurus

764

765

766

767 *[Note from Secretariat: will need to be developed and is intended to include*  
768 *the various terms used in the national and regional pharmacopoeias]*

769

770 *Active pharmaceutical ingredient (API)*

771 A substance used in a finished pharmaceutical product (FPP), intended to furnish  
772 pharmacological activity or to otherwise have direct effect in the diagnosis, cure,  
773 mitigation, treatment or prevention of disease, or to have direct effect in restoring,  
774 correcting or modifying physiological functions in human beings.

775

776 *Dosage form*

777 The form of the completed pharmaceutical product, e.g. tablet, capsule, elixir or  
778 suppository.

779

780 *Finished pharmaceutical product (FPP)*

781 A finished dosage form of a pharmaceutical product that has undergone all stages of  
782 manufacture, including packaging in its final container and labelling.

783

784

785

786
